

What is E-Liquid or Juice

By: E McAtarsney
Monday, 04th February 2013

It is commonly made up of three components

Nicotine

Obviously the stimulant and the dependency substance contained in regular cigarettes.It comes in different strengths and over a period of time can be reduced,placing more emphasis on taste. Strengths usually range from 20mg down to 0mg.The nicotine level is expressed in milligram(mg) To simplify and get an approximate strength place a decimal point between the digits.So 20mg equates to 0.20% nicotine level.

Flavouring

Nicotine on its own has no significant taste or smell,so to create the taste in e-liquid a food grade flavour needs to be introduced.New flavours are constantly being introduced and we strive to bring you only the best from across the world.

Vapour agent

There are two types of agents to create the vapour process.PG- Propylene Glycol is the most common. VG- Vegetable Glycerin for people with allergies/sensitivity to PG.The vast majority of people with e-cigarettes or vaping are using PG.

Our E-Juice

We supply e-juices/e-liquids in several kinds of bottles with different manufacturers with their labelling showing different positions for production date and ingredients etc.

Is it safe to "smoke" e-liquid?
